# TRAFFIC VOLUMES 1977 ON THE KING'S HIGHWAY AND SECONDARY HIGHWAYS

PROVINCIAL ROADS PLANNING OFFICE  
MUNICIPAL / PROVINCIAL TRANSPORTATION BRANCH

Ministry of  
Transportation and  
Communications

## PREFACE

In this publication, the Ministry of Transportation and Communications provides a summary of the sectional traffic volumes and accident rates on the Provincial Highway Systems as of December 31, 1977. Local conditions may cause variations in the volume within the section of highway listed, but on the whole these sections are considered to be adequately represented by the volume shown. A Provincial Summary of Travel Experience (M.V.KM.) and Accident Data has also been illustrated in the table and graphs on the following pages.

The format of this book is such that the King's Highway, including the Queen Elizabeth Way, the 400 Series of Highways, the Kitchener - Waterloo Expressway, the Conestoga Parkway and Highways 2 to 169, are listed first. The Secondary Highways, numbered from 500 to 667, are listed next, commencing with page 182. Overlaps have been recorded either on an overlapping freeway or the lower numbered highway, whichever the case may be.

The following data is given for each section of highway for which the end points are described in the first column (LOCATION DESCRIPTION):

KM:                      The length of the section in kilometres and tenths of a kilometre.

PATT TYPE:            The pattern type as used by the Ministry to indicate the variability of traffic flows. Accumulated volume data records have been used to group the patterns of seasonal variation of traffic as follows:

- i)    low variation, or commuter traffic,
- ii)   intermediate variation, a blend of all types of traffic, and
- iii) high variation, including recreational and tourist traffic distinguished by weekend to weekday relationships.

These have been further subdivided into the following specific pattern types:

### Low Variation or Commuter

- U.C. - Urban Commuter
- S.C. - Suburban Commuter
- C. - Commuter

Intermediate Variation

I.C. - Intermediate Commuter  
C.R. - Commuter Recreation  
I.R. - Intermediate Recreation  
CTR. - Commuter - Tourist - Recreation  
I.T. - Intermediate Tourist

High Variation - Tourist

L.T. - Low Tourist  
T. - Tourist  
H.T. - High Tourist

High Variation - Recreation

L.R. - Low Recreation  
R. - Recreation  
H.R. - High Recreation

- A.A.D.T., Annual Average Daily Traffic; which is defined as the average twenty-four hour two-way traffic for the period January 1st to December 31st.
- S.A.D.T. Summer Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st, including weekends.
- S.A.W.D.T. Summer Average WeekDay Traffic; which is defined as the average twenty-four hour two-way weekday traffic for the period July 1st to August 31st, excluding weekends. Weekend traffic is deemed to start at noon on Friday and end at noon on Monday for a normal short-weekend. A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.
- W.A.D.T. Winter Average Daily Traffic; which is defined as the average twenty-four hour two-way traffic for the period December 1st to March 31st, including weekends.
- A.R. Accident Rate; which is defined as the number of accidents per Million Vehicle Kilometres (M.V.KM.) of travel for the period January 1st to December 31st. M.V.KM. equals the length of a section in kilometres times 365 days times the A.A.D.T.

Where no rate is given for a section, it is because there have been no accidents on that section and the rate, therefore, is zero.

Note that this is the first year accident rates have been based on M.V.KM., and consequently the rates are lower than in previous years' publications, which were based on Million Vehicle Miles (M.V.M.). Past years' data on the ~~summary~~ table and graphs in this book have been converted to M.V.KM. equivalents.

Measuring traffic flows in the Province of Ontario is a major task. Systematic samples of existing traffic flows are obtained throughout the year and the traffic volumes in this book have been calculated from them using accepted mathematical models. It should be emphasized that the values given are estimates based on these samples taken throughout the year, and that each section is actually counted only once every three years. Extensive continuous counting would be both unmanageable and prohibitive in cost.

Any further inquiries may be directed to the Provincial Roads Planning Office, Ministry of Transportation and Communications, Downsview at (416) 248-3066.

PROVINCIAL ROADS PLANNING OFFICE  
MUNICIPAL / PROVINCIAL TRANSPORTATION BRANCH

Ontario

Ministry of  
Transportation and  
Communications

## PREFACE

In this publication, the Ministry of Transportation and Communications provides a summary of the sectional traffic volumes and accident rates on the Provincial Highway Systems as of December 31, 1978. Local conditions may cause variation in the volume within the sections of highway listed, but on the whole these sections are considered to be adequately represented by the volume shown. A Provincial Summary of Travel Experience (M. V. KM. ) and Accident Data has also been illustrated in the table and graphs on the following pages.

The format of this book is such that the King's Highway, including the Queen Elizabeth Way, Highways 2 to 169 and the 400 Series of Highways, are listed first. The Secondary Highways, numbered from 500 to 667, are listed next, commencing with page 181. Overlaps have been recorded either on an overlapping freeway or the lower numbered highway, whichever the case may be.

The following data is given for each section of highway for which the end points are described in the first column (LOCATION DESCRIPTION):

- KM:                      The length of the section in kilometres and tenths of a kilometre.
- PATT TYPE:              The pattern type as used by the Ministry to indicate the variability of traffic flows. Accumulated volume data records have been used to group the patterns of seasonal variation of traffic as follows:
- i)              low variation, or commuter traffic,
  - ii)             intermediate variation, a blend of all types of traffic, and
  - iii)            high variation, including recreational and tourist traffic distinguished by weekend to weekday relationships.

These have been further subdivided into the following specific pattern types:

### Low Variation or Commuter

- U.C.    -    Urban Commuter
- S.C.    -    Suburban Commuter
- C.    -    Commuter

Intermediate Variation

I. C.	-	Intermediate Commuter
C. R.	-	Commuter Recreation
I. R.	-	Intermediate Recreation
CTR.	-	Commuter - Tourist - Recreation
I. T.	-	Intermediate Tourist

High Variation - Tourist

L. T.	-	Low Tourist
T.	-	Tourist
H. T.	-	High Tourist

High Variation - Recreation

L. R.	-	Low Recreation
R.	-	Recreation
H. R.	-	High Recreation

A graphical presentation of these pattern types has also been included on the following pages.

- A. A. D. T.      Annual Average Daily Traffic; which is defined as the average twenty-four hour two-way traffic for the period January 1st to December 31st.
- S. A. D. T.      Summer Average Daily Traffic; which is defined as the average twenty-four hour, two-way traffic for the period July 1st to August 31st, including weekends.
- S. A. W. D. T.      Summer Average Weekday Traffic; which is defined as the average twenty-four hour two-way weekday traffic for the period July 1st to August 31st, excluding weekends. Weekend traffic is deemed to start at noon on Friday and end at noon on Monday for a normal short-weekend. A long holiday weekend would have an additional day either commencing at noon on the Thursday or ending at noon on the Tuesday, depending on whether the holiday falls on the Friday or the Monday.
- W. A. D. T.      Winter Average Daily Traffic; which is defined as the average twenty-four hour two-way traffic for the period December 1st to March 31st, including weekends.

A. R.

Reportable accidents are defined as those causing any death or injury or damage exceeding \$400. In 1978 this was an increase from \$200. Further, accidents on freeway ramps have not been included in any rate calculations.

Accident Rate is defined as the number of accidents per Million Vehicle Kilometres (M. V. KM. ) of travel for the period January 1st to December 31st. M. V. KM. equals the length of a section in kilometres times 365 days times the A. A. D. T. and divided by a million.

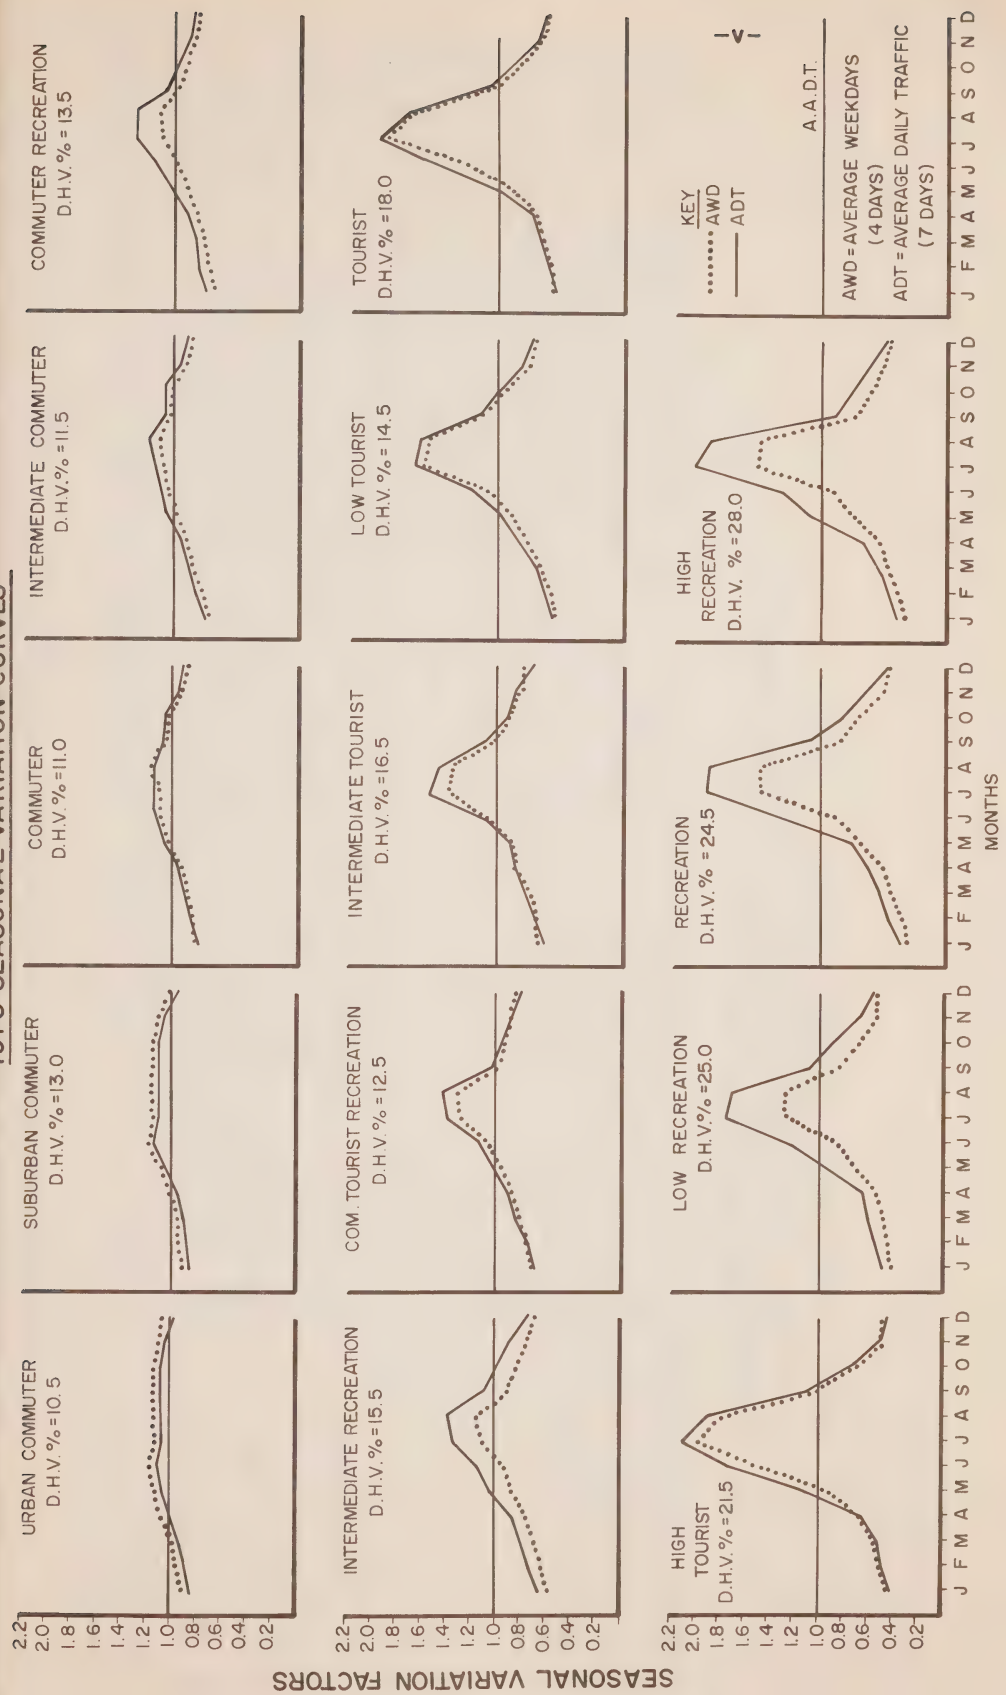

Where no rate is given for a section no accidents occurred on that section and the rate, therefore, is zero.

Measuring traffic flows in the Province of Ontario is a major task. Systematic samples of existing traffic flows are obtained throughout the year and the traffic volumes in this book have been calculated from them using accepted mathematical models. It should be emphasized that the values given are estimates based on these samples taken throughout the year, and that each section is actually counted only every three to five years depending on the highway. Extensive continuous counting would be both unmanageable and prohibitive in cost.

Any further inquiries may be directed to the Provincial Roads Planning Office, Ministry of Transportation and Communications, Downsview at (416) 248-3066.
